Our research group has openings beginning in August 2016 for 1-2 graduate students with interests in genetics, behavior and evolution. One project involves phylogeography of small mammals and the other examines the relationship between dispersal and genetics. We are looking for students who have research experience, and would prefer students who have experience using molecular genetics to address evolutionary or behavioral questions. Students will receive stipends and tuition waivers during while in graduate school. More details about the MS or PhD in Biology at Miami University can be found here:
